SUPPORT HAS BECOME COLLABORATIVE

- SILOed, reactive and metadata-driven support doesn't work anymore
- Product, sales, engineering team needs to be nimble. Visibility and collaborative workflows between teams is key
- Modernizing support to protect existing business and expand renewal has become CEO's top priority

EXTRACT SIGNALS FROM UNSTRUCTURED DATA

I just received a *"Max UDID reached"* message trying to install Docker beta on my production instance. I'm trying to test the Docker Windows beta and have installed as follows:

1) On a Windows VM running on my Mac (sharing drives does not work.)

2) On an three year old Acer laptop (sharing volumes does not work.)

3) On a new Windows Surface Pro 4 (sharing volumes does work, but the machine isn't really development-capable.)

4) On a new Windows Surface Book (received the Max UDID reached message.)

I bought the machine in step (3) last Friday, and traded it for the machine in (4) this afternoon. So, I will be doing no further testing on machines (1) - (3), and can't activate Docker on machine (4) -- the one I'm currently using.

Can you help? I'm frustrated and this needs to be resolved ASAP, otherwise we will have to move to coreOS rocket container. Please resetting token shouldn't be this difficult. (And yes, I've reported the issues found.)

Thanks,

Jim
