marshmallow

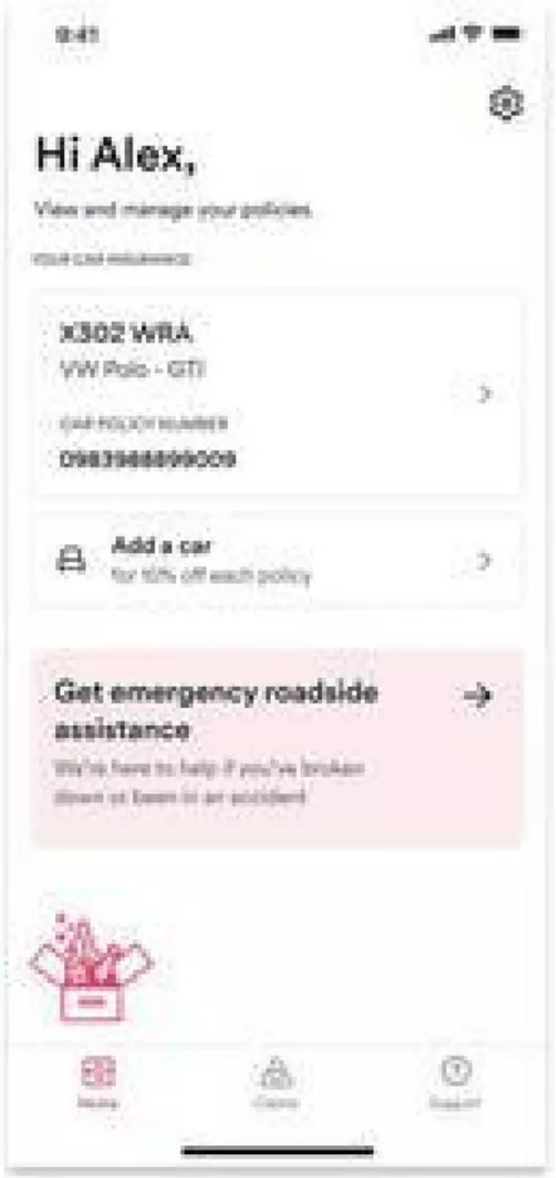

We use technology to build products that are affordable, instant and inclusive to build a world where insurance benefits everyone.

Everything's online

It takes under 5 minutes to get car insurance from us and we expect to offer a similar experience for other insurance products over time. Once someone is our customer, our technology platform makes managing your policy an easy experience.

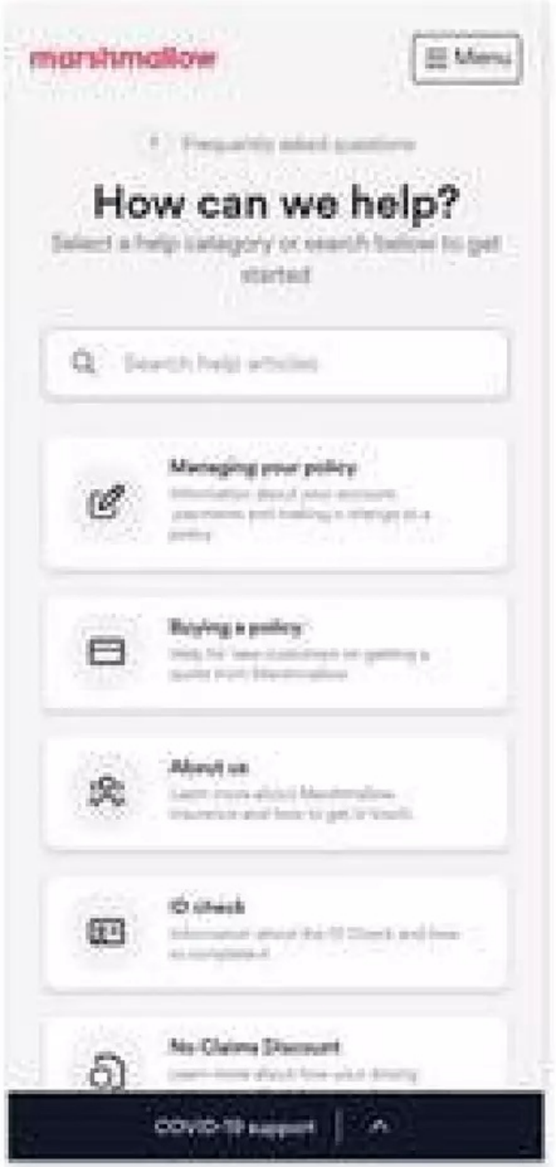

They can make over 90% of changes online through their customer account and over 60% of customer queries are solved by our customer experience AI bot.

We offer scalable, efficient support

Axa, Allianz and Zurich still use intermediaries and are far less efficient than direct to consumer insurers such as Admiral and Direct Line Group.

When we compare Marshmallow to these companies we are significantly more efficient

Next-generation pricing

We have combined traditional insurance pricing models with data science techniques to build complex machine learning models that deliver results.

These models use structured and unstructured data sources, fed automatically through sophisticated pipelines, to make accurate predictions.

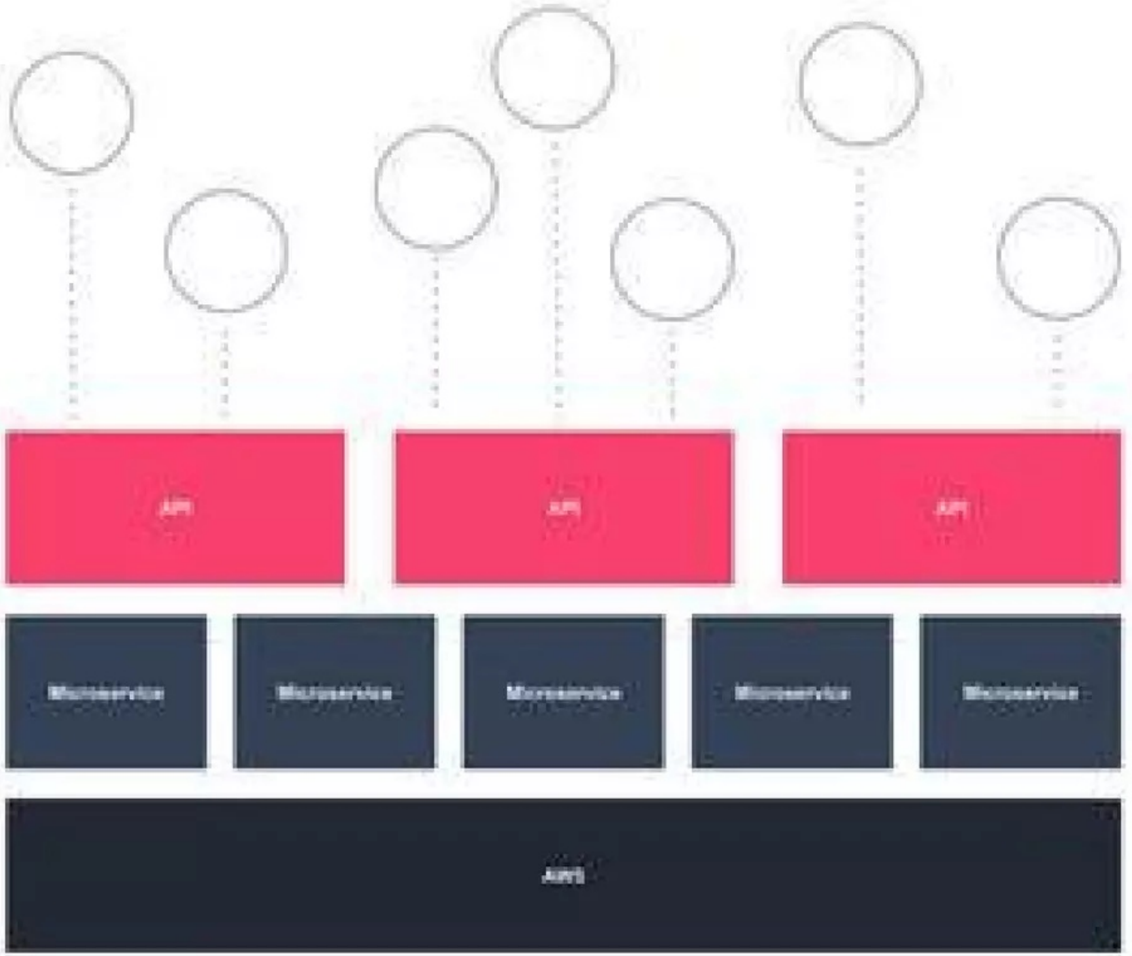

Everything is built on our own software in Java microservices

Marshmallow is an insurance company driven by technology that has built everything in-house on a digital platform.

By leveraging technology we have built next generation pricing models, machine learning fraud models, customer service artificial intelligence (AI) bots, unique ID verification processes and a customer experience that is always at your fingertips.

Owning the full technical stack is a huge advantage.

Our future

From here we want to launch other products and countries

There are 30 million cars insured in the UK – car insurance is a huge market to start in, but our ambition is to offer multiple insurance products and, in time, operate in other countries.
